[Open chart](#)

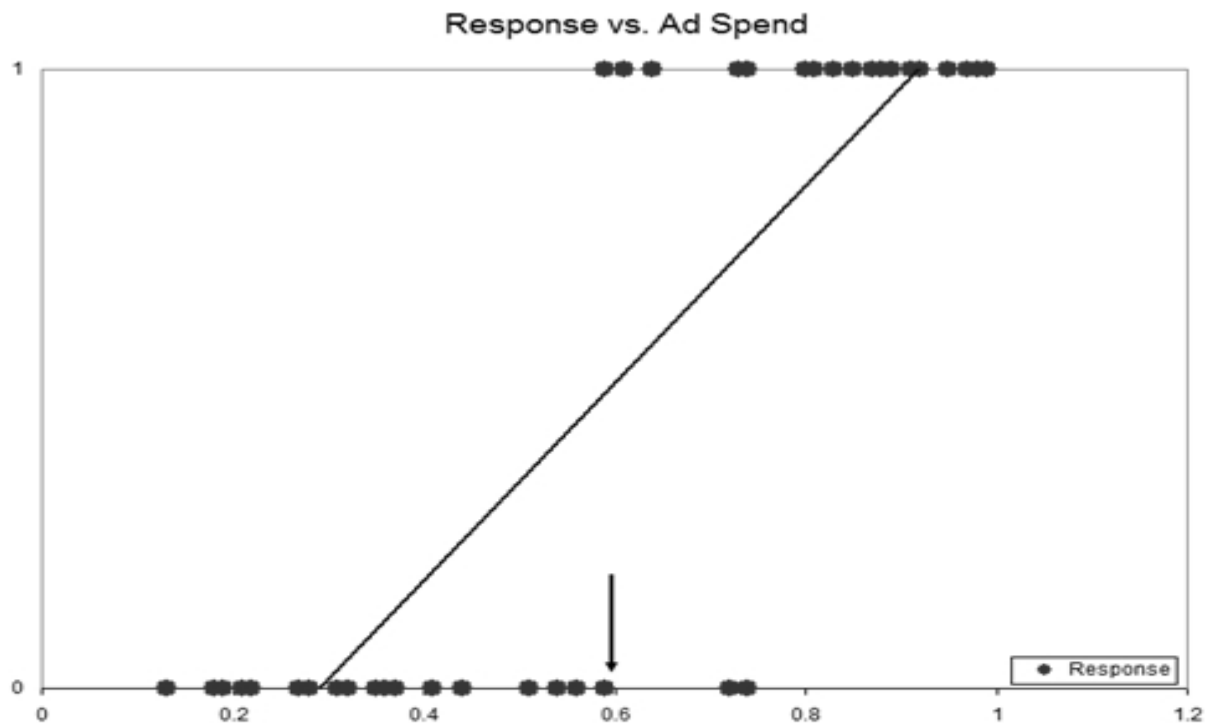

Linear Regression Model. We can make an intuitive assessment that increase in *Ad spend* also increases *Sales*. Using the straight line, we may also be able to predict.

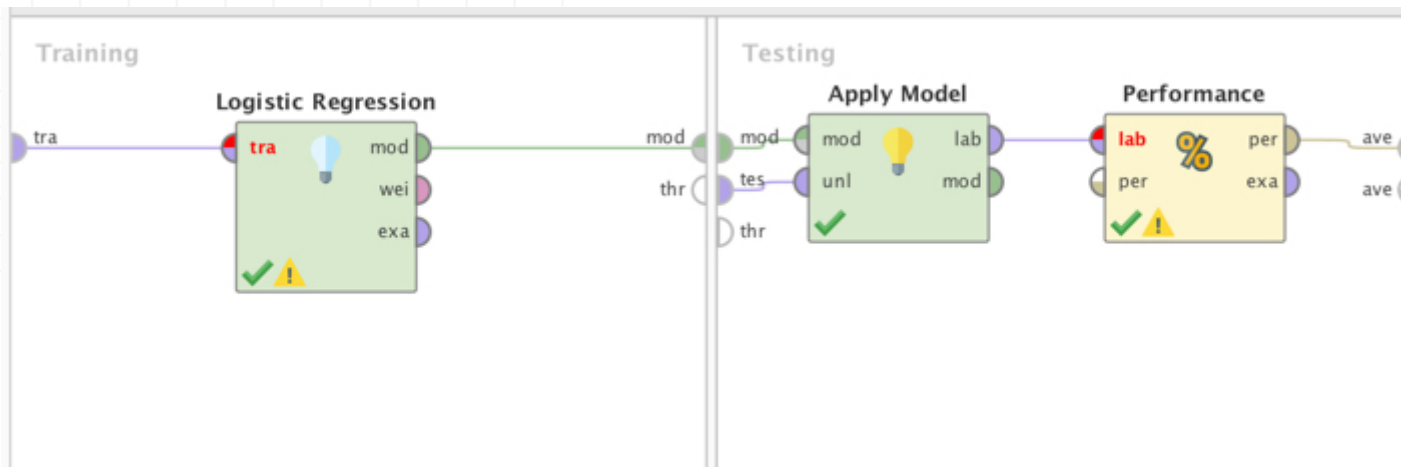

Linear Fit for a Binary outcome: Although we can make an intuitive assessment that increase in *Ad spend* increases *Response*, the switch is abrupt – around 0.6. Using the straight line, we cannot really predict outcome.

Logistic Regression Model. The S-shaped curve is clearly a better fit for *most* of the data. We can state *Ad spend* increases *Sales*, **and** we may also be able to predict using this model.

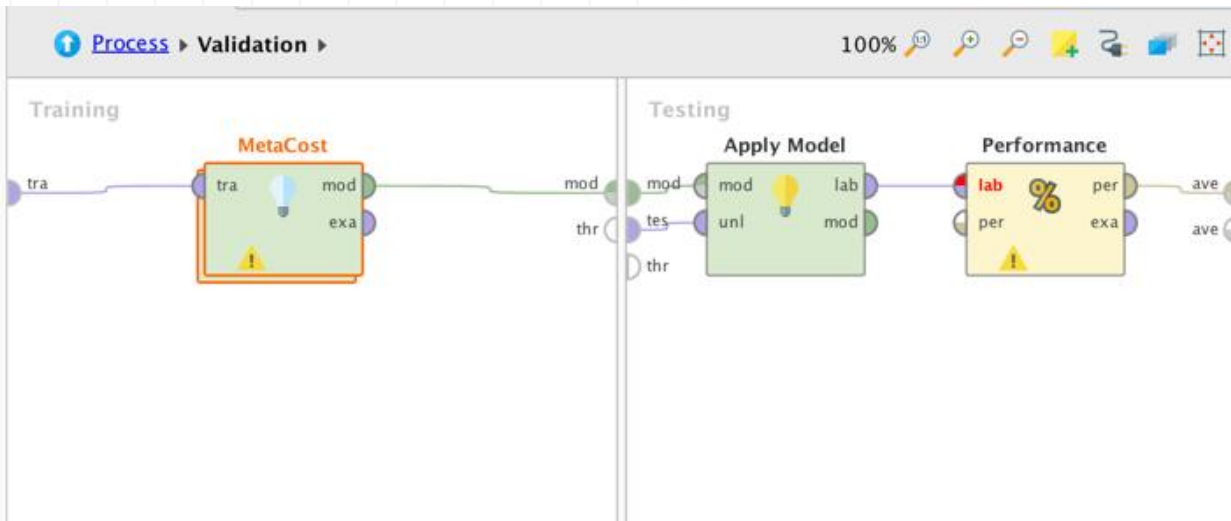

Survived ● Yes ● No

accuracy: 83.33%

	true N	true Y	class precision
pred. N	21	3	87.50%
pred. Y	2	4	66.67%
